

SpamSquelcher not only reduces the amount of spam entering your network, it delivers big savings: over a 12 month period you will need a lot less resources to cope with email when you employ squelching.

Graph of relative email volumes (and email resource requirements) on a typical enterprise network over a 12 month period, with filtering as the first line of defense, versus squelching (activated in month 3).

Assumptions:  
 50 messages per day at start of first month, half of which is spam. Month-on-month growth of legitimate email is assumed to be 5%. Month-on-month spam growth is assumed to be 20%.
